

Last Time: Change of Basis!

Represent a linear map $L: V \rightarrow W$
via many matrices...

Special Cases: If $V=W$ and $L=id$.

$\text{Rep}_{B,D}(id)$ is the matrix representing
the change of basis B to D .

$$\text{Rep}_{B',D'}(L) = \text{Rep}_{D,D'}(id) \cdot \text{Rep}_{B,D}(L) \cdot \text{Rep}_{B',B}(id)$$

The equation is annotated with colored underlines and curved arrows: $\text{Rep}_{D,D'}(id)$ is underlined in yellow, $\text{Rep}_{B,D}(L)$ is underlined in pink, and $\text{Rep}_{B',B}(id)$ is underlined in green. Blue curved arrows connect the underlined terms to the corresponding nodes in the diagram above: from the yellow underline to $V_{B'}$ and $W_{D'}$, from the pink underline to V_B and W_D , and from the green underline to $V_{B'}$ and W_D .

WHY?: Some bases make for really simple
representations of your linear map...

Remark: Some "nice" linear operators can be
represented by diagonal matrices...

Ex: Consider the spaces $V = P_2(\mathbb{R})$ and $W = M_{2 \times 2}(\mathbb{R})$.

$$B = \{1, 1+x, 1+x^2\}, \quad B' = \{1, x, x^2\} \subseteq V$$

$$D = \left\{ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 1 & 1 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}, \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \right\} \quad \begin{pmatrix} a & b \\ c & d \end{pmatrix} \mapsto \begin{pmatrix} a \\ b \\ c \\ d \end{pmatrix}$$

$$D' = \left\{ \begin{pmatrix} -1 & 0 \\ 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & -1 \\ 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \right\}$$

① Build $\text{Rep}_{B,B'}(\text{id}_V)$ and $\text{Rep}_{D,D'}(\text{id}_W)$.

$$[B'|B] \rightsquigarrow \left[\begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right] \rightsquigarrow \text{Rep}_{B,B'}(\text{id}_V) = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$[D'|D] \rightsquigarrow \left[\begin{array}{cccc|cccc} -1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & -1 & 0 & 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 \end{array} \right] \rightsquigarrow \left[\begin{array}{cccc|cccc} 1 & 0 & 0 & 0 & 0 & 0 & 0 & -1 \\ 0 & 1 & 0 & 0 & 0 & 0 & -1 & -1 \\ 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 \end{array} \right]$$

$$\therefore \text{Rep}_{D,D'} = \begin{bmatrix} 0 & 0 & 0 & -1 \\ 0 & 1 & 1 & -1 \\ 0 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{bmatrix}$$

② Suppose $L: V \rightarrow W$ is represented by

$$\text{Rep}_{B,D}(L) = \begin{bmatrix} 2 & 1 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & -1 \end{bmatrix}. \quad \text{What is } \text{Rep}_{B',D'}(L)?$$

$$\begin{array}{ccc} V_B & \xrightarrow{\text{Rep}_{B,D}(L)} & W_D \\ \text{Rep}_{B,B'}(\text{id}) \downarrow \nearrow & & \downarrow \nwarrow \text{Rep}_{D,D'}(\text{id}) \\ V_{B'} & \xrightarrow{\text{Rep}_{B',D'}(L)} & W_{D'} \end{array}$$

$$\therefore \text{Rep}_{B', D'}(L) = \text{Rep}_{D, D'}(\text{id}) \cdot \text{Rep}_{B, D}(L) \cdot \text{Rep}_{B', B}(\text{id})$$

Now we compute $\text{Rep}_{B', B}(\text{id}) = \text{Rep}_{B, B}(\text{id})^{-1}$

$$\left[\begin{array}{ccc|ccc} 1 & 1 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right] \rightarrow \left[\begin{array}{ccc|ccc} 1 & 0 & 0 & 1 & -1 & -1 \\ 0 & 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 1 \end{array} \right]$$

$$\therefore \text{Rep}_{B', B}(\text{id}) = \begin{bmatrix} 1 & -1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \text{ so finally:}$$

$$\text{Rep}_{B', D'}(L) = \begin{bmatrix} 0 & 0 & 0 & -1 \\ 0 & 0 & -1 & -1 \\ 0 & 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} 2 & 1 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & -1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 2 & 0 \end{bmatrix} \begin{bmatrix} 1 & -1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} -1 & 1 & 2 \\ -1 & 1 & 1 \\ 0 & 1 & 0 \\ 2 & 0 & -2 \end{bmatrix}$$

Eigenvectors and Eigenvalues

Goal: Understand when a matrix can be diagonalized...

↳ On hold... we'll build up to this ☺

Defn: Let $L: V \rightarrow V$ be a linear operator.

◦ An eigenvector of L is an element $v \in V$ such that $L(v) = \lambda v$ for some scalar λ .

② The eigenvalue of eigenvector $v \in V$ for L is the scalar λ with $L(v) = \lambda v$.

More succinctly: An eigenvector of L w/ eigenvalue λ is a vector $v \in V$ with $L(v) = \lambda v$. ★

NB: "eigen" means (roughly) "same" in German.

Ex: Consider the transformation $L: \mathbb{R}^3 \rightarrow \mathbb{R}^3$ given by $L\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 3x \\ 5y \\ 0 \end{pmatrix}$. Note that

$L(e_1) = \begin{pmatrix} 3 \\ 0 \\ 0 \end{pmatrix} = 3e_1$ so e_1 is an eigenvector of L with eigenvalue 3.

$L(e_2) = 5e_2$ so e_2 is an eigenvector of L w/ eigenvalue 5.

$L(e_3) = \vec{0}$ so e_3 is an eigenvector w/ eigenvalue 0...

$L(\vec{0}) = \vec{0} = \lambda \vec{0}$ for all $\lambda \in \mathbb{R}$...

But for technical reasons, we do NOT call $\vec{0}$ an eigenvector...

Remark: v is an eigenvector w/ eigenvalue 0 if and only if $v \in \ker(L)$.

↳ Exercise: prove it!

Prop: If v, w are eigenvectors of L w/ eigenvalue λ , then

- ① av also has eigenvalue λ .
- ② $v+w$ also has eigenvalue λ .

Q: How do I compute eigenvalues and eigenvectors?

Note: $L(v) = \lambda v$ if L is represented by

$\text{Rep}_{B,B}(L) = M$, then we're asking for:

$$Mu = \lambda u = \lambda I_n u$$

$$\text{so } Mu - \lambda I_n u = 0$$

$$\text{i.e. } \underline{(M - \lambda I_n)u} = 0$$

So this transformation has u in its kernel...

$$\text{Thus } \underline{\det(M - \lambda I_n)} = 0 \dots$$

Defⁿ: The characteristic polynomial of matrix M
(or more generally the operator associated to M) is
the polynomial $\underline{p_M(\lambda)} := \det(M - \lambda I)$.

Point: Every eigenvalue of M is a root
of the characteristic polynomial $p_M(\lambda)$.

Ex: Compute $p_M(\lambda)$ for $M = \begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & -1 \\ 0 & 1 & 0 \end{bmatrix}$.

Sol: $p_M(\lambda) = \det(M - \lambda I)$

$$\begin{aligned} &= \det \begin{bmatrix} 1-\lambda & 0 & 1 \\ 1 & 1-\lambda & -1 \\ 0 & 1 & -\lambda \end{bmatrix} = (1-\lambda) \det \begin{bmatrix} 1-\lambda & -1 \\ 1 & -\lambda \end{bmatrix} - \det \begin{bmatrix} 0 & 1 \\ 1 & -\lambda \end{bmatrix} + 0 \\ &= (1-\lambda)(-\lambda(1-\lambda) + 1) - (-1) \\ &= (1-\lambda)(1-\lambda+\lambda^2) + 1 \end{aligned}$$

$$= (1 - \lambda + \lambda^2) - \lambda(1 - \lambda + \lambda^2) + 1$$

$$= 1 - \lambda + \lambda^2 - \lambda + \lambda^2 - \lambda^3 + 1$$

$$= -\lambda^3 + 2\lambda^2 - 2\lambda + 2$$

Ex: Consider $L\left(\begin{pmatrix} x \\ y \\ z \end{pmatrix}\right) = \begin{pmatrix} 5x \\ -y \\ 0 \end{pmatrix}$. This transformation

has matrix $M = \begin{bmatrix} 5 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 0 \end{bmatrix}$ wrt E_3 . We

compute $P_M(\lambda) = \det(M - \lambda I)$

$$= \det \begin{bmatrix} 5-\lambda & 0 & 0 \\ 0 & -1-\lambda & 0 \\ 0 & 0 & -\lambda \end{bmatrix} = (5-\lambda)(-1-\lambda)(-\lambda)$$

$$= \lambda(\lambda+1)(5-\lambda).$$

which has roots $\lambda = 0$, $\lambda = -1$, and $\lambda = 5$.
